

Network Development Process

Version 5 - May 2021

About this brochure

This brochure provides an outline of our landholder engagement and planning approval process. We undertake extensive consultation with affected landholders and other stakeholders to ensure we have considered all relevant matters in determining the most appropriate location for our proposed infrastructure.

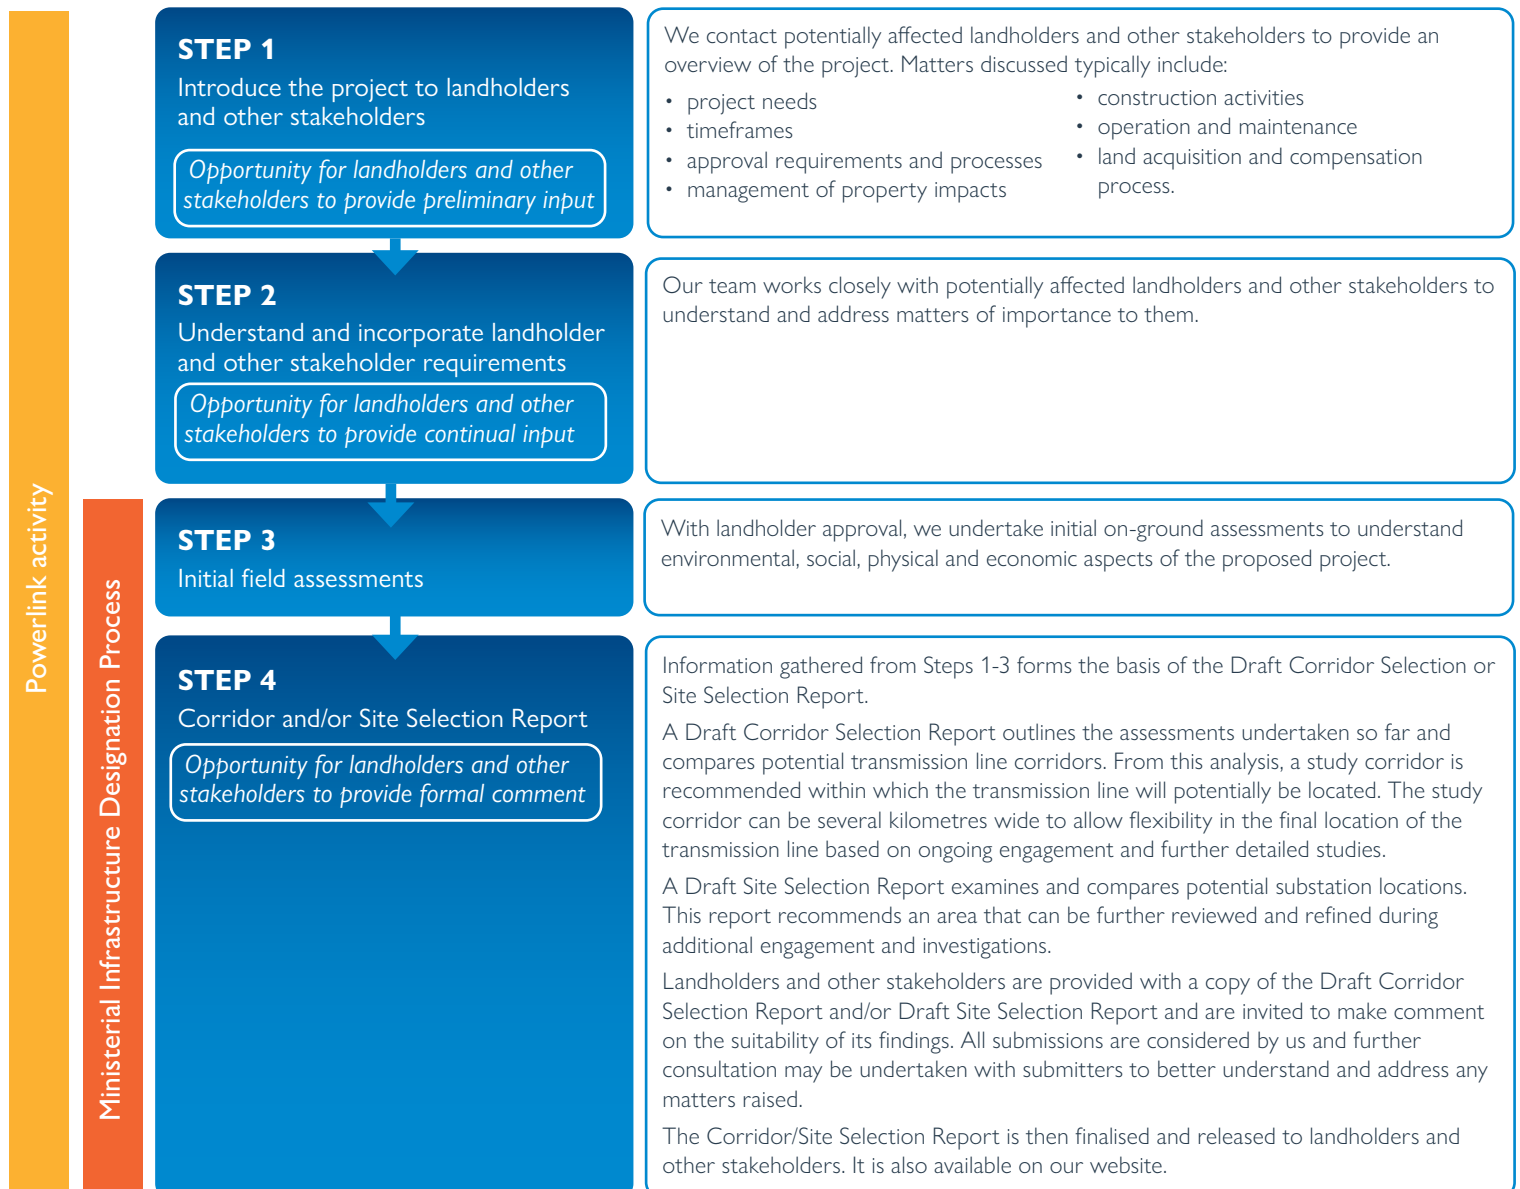

Alternative approval pathways may be followed (for example development application) where a customer assumes responsibility for the planning and development of transmission infrastructure.

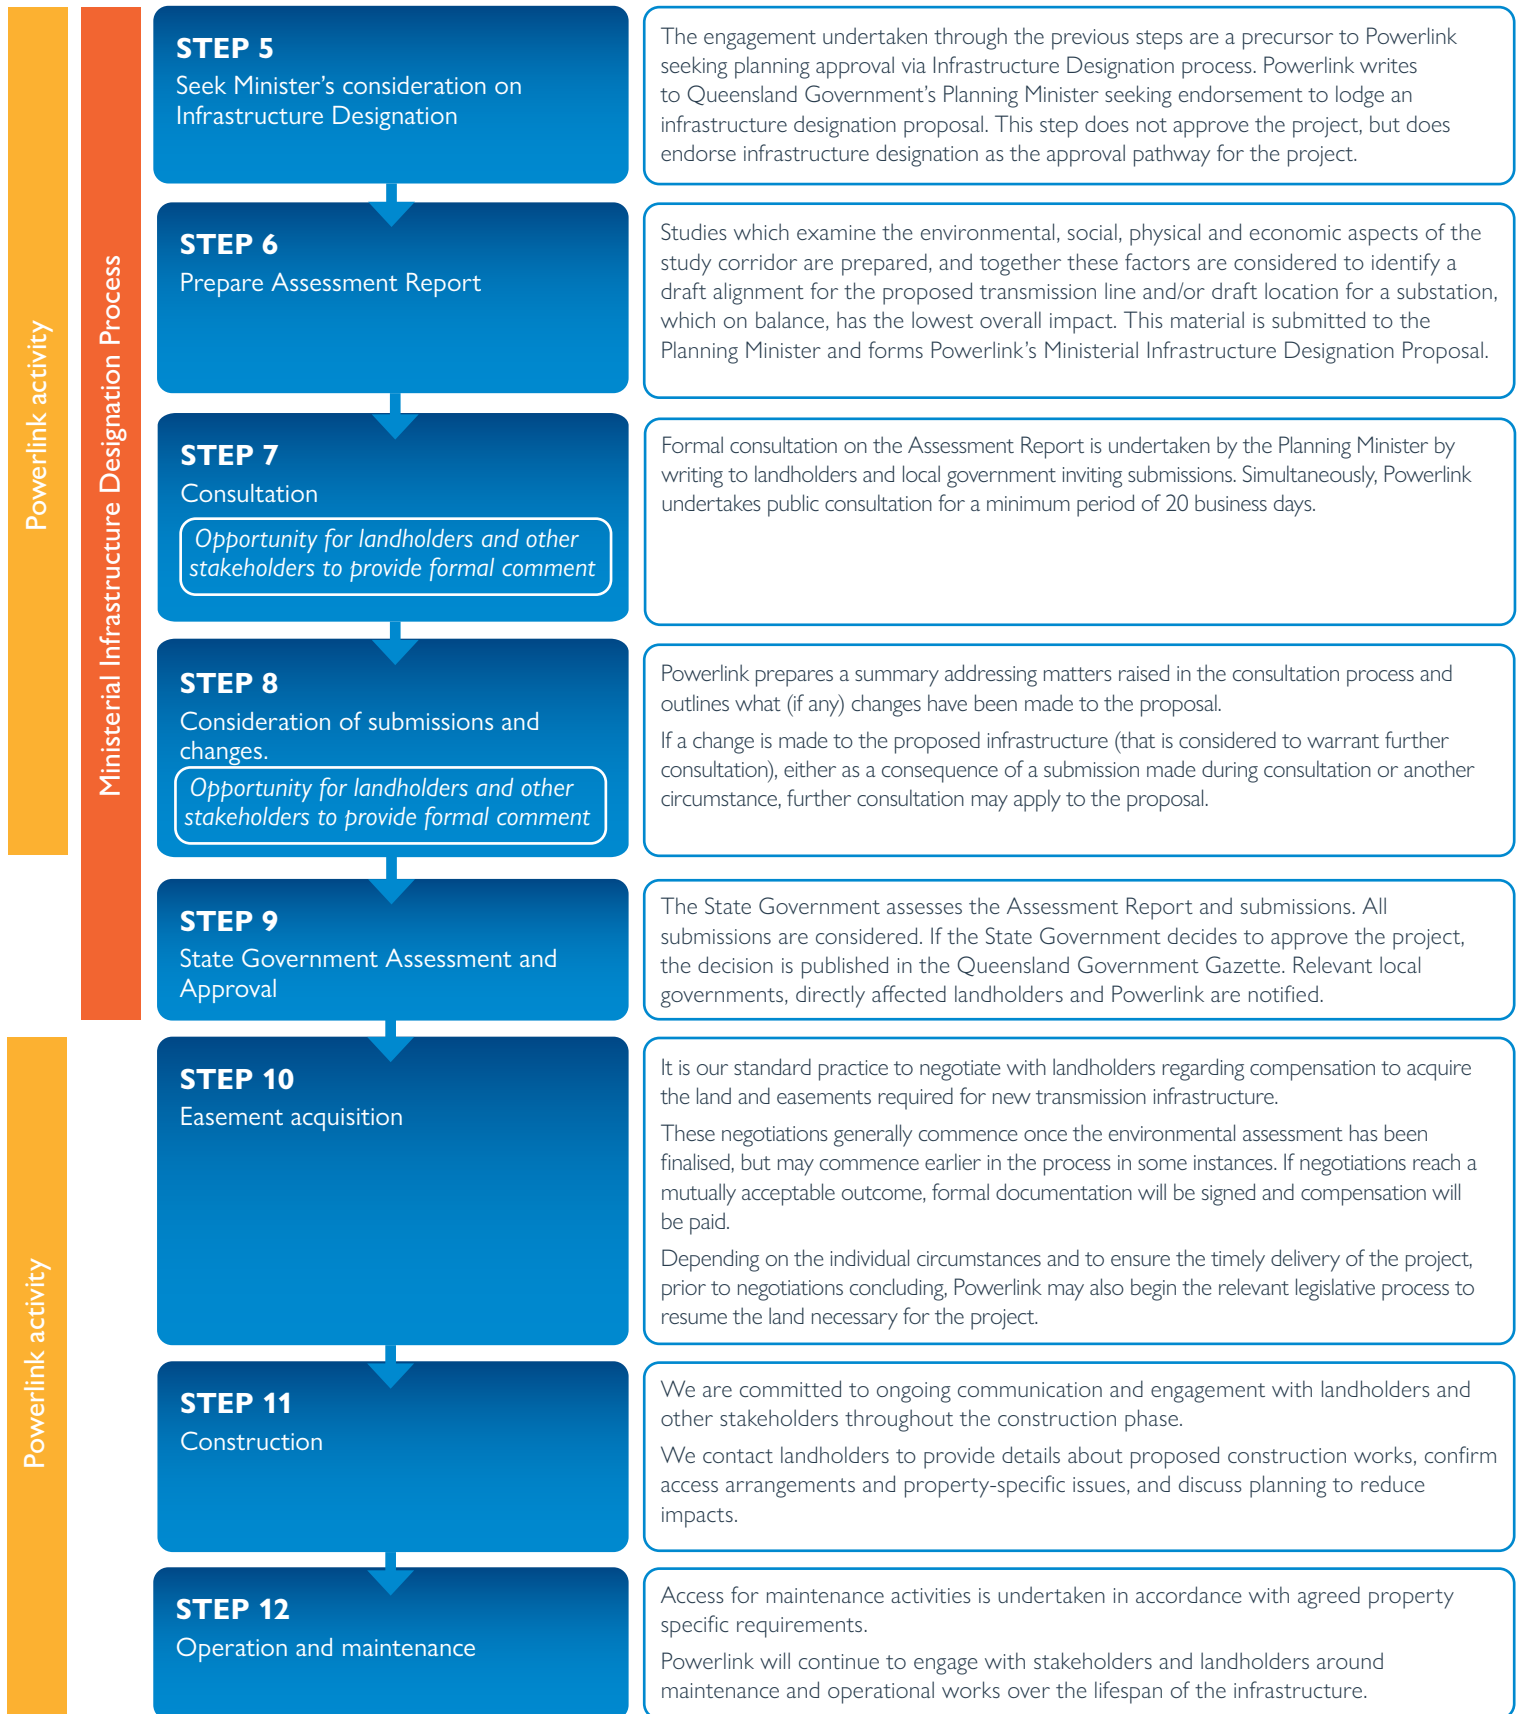

Landholder engagement and planning approval process

Much like obtaining approval to build a house, we seek town planning and environmental approvals prior to constructing new electricity infrastructure. Given the nature of this infrastructure, we typically seek approvals at the State and Federal Government level.

The landholder engagement and planning approval steps that we follow for large projects are outlined below and incorporate the [Ministerial Infrastructure Designation](#) process in the Queensland Government's *Planning Act 2016*.

Our Landholder Relations team will take you through the process and are happy to assist with any queries you may have as things progress.
